

System and Method for Raising Funds and Establishing User Affinity Over a Distributed Network

Abstract

A fundraising system and method that allows users to raise money from friends and other entities over a distributed network, such as the Internet, is presented. The present invention provides online marketing applications for e-businesses by using the power of viral marketing to enable clients to attract new customers at a lower cost, and build brand loyalty. For example, the fundraising system of the present invention enables e-businesses to partner with causes, such as charitable, non-profit and community organizations, to host fundraising events online with interactive participation by all involved. For example, an e-mail networking component may enable fund-raisers to send out an infinite amount of requests supporting the cause they care about. Thus, for every fund-raiser, the host e-business gets a new flow of visitors to their site.
